You may have concerns about adding an injectable drug to your daily routine. But it's important to notice a positive impact that may have on your diabetes management. When you gain a little workout, levemir® injections can become part of your daily routine. See instructions for use » You may have concerns about adding an injectable drug to your daily routine. But it's important to notice a positive impact that may have on your diabetes management. When you gain a little workout, levemir® injections can become part of your daily routine. See instructions for use » Low Injection Force Push Button. A built-in spring mechanism requires low force to inject all doses. Once your dosage is delivered, you should hear or feel the exact clicka dosage. In turn choosing the dosage to select the number of units you need to inject, from 1 to 80 units of Levemir® FlexTouch® should be used with caution in patients with visual impairment who may rely on audible clicks to dial the dose of their thinnest needle available. The 32G tip needle is the thinnest needle made by Novo Nordisk,b a leader in diabetes care for more than 90 years more insulin than vial. A box of Levemir® FlexTouch® contains 5 disposable pens, each pre-filled with 300 units of Levemir® for a total of 1,500 units of insulin ® Levemir. You will get 50% more insulin than you get from vial (1000 units) of insurance coverage. Levemir® FlexTouch® is covered by most health insurance and Medicare programs nationwide have returned aAfter dose counters to 0, keeping needles in the skin for 6 seconds before the needle is removed. If you didn't, you may have received your full dose and you should check your blood sugar further as you may need more insulin. You may or may not hear an audible click at the end of the dose. BNeedles are sold separately and may require prescriptions in some states. Needle and Levimir® FlexTouch® should not be shared. If you prefer your insulin with vials and syringes or if you need to get your insulin on the vial for insurance reasons, Levemir® is also available on the vial. Unused Lumiere® Flex Touch® Store the pens and vials in the fridge at 36 degrees Fahrenheit to 46 degrees Fahrenheit (2 to 8 °C), freeze the ®. Don't use Levemir® If it's frozen keep Levemir uno open® in cartons to protect the unused light pen and the vial may be used until the expiry date printed on the label, if keep in the fridge at room temperature (below 86oF) or refrigerate for up to 6 weeks keep away from direct heat and excrete light after 42 days, even if insulin is left in the pen or vial Levimire does not save® FlexTouch® with needles in place if you have commercial insurance, such as the insurance you receive through your employer or buy yourself, you may be eligible to pay as little as \$45 per supply 30 days to 24 months.c if you have commercial insurance, such as the insurance you receive through your employer or buy yourself, you may be eligible to pay as much as \$45. Be Supplied 30 days to 24 months.c Cornerstones4Care® offers bite-sized, everyday lessons in eating better, moving more, and treating diabetes that you can learn in 5 minutes or less. Lyomir ® man-made film that is used to control high blood sugar in adults and children with diabetes mellitus. It is ® for use for the treatment of diabetic ketocytosis. Will Levemir himself ® FlexTouch® with other people, even if the needle has changed. You may get to other people a serious infection, or a serious infection from them. Make Lumiere ® if: you have sensitivity to Levemir® or any of the ingredients in Levemir®. Before taking Levimir® tell your health care provider about all your medical conditions including, if you are: pregnant, planning to get pregnant, or breastfeeding. Taking a new prescription or over-the-counter medications, including supplements. Talk to your health care provider about how to manage low blood sugar. Read the instructions to use and exactly as directed. Know the type and strength of your insulin. Change your insulin type unless your health care provider will tell you. Change (rotate) your injection sites within the area you choose with each injection to reduce your risk of taking lipodystrophy (pits in the skin or thick skin) and local cutaneous amyloidosis (skin with lumps) at injection sites. It does not use the exact same point for each injection. Do not inject where the skin pits, thick, or has mass. Injections where the skin is tender, bruised, scaly or hard, or damaged to the wound or skin. Check your blood sugar levels. Ask your health care provider what your blood sugar levels should be and when you should check them out. Don't reuse or exchange your needle or syringe with other people. You may get to other people a serious infection, or a serious infection from them. Never inject lumiere ® muscle or muscle. Whether driving or operating heavy machinery, as long as you know how it affects you. Do not drink alcohol and use medications that contain alcohol. Serious side effects can lead to death, including: low blood sugar. Some of the signs and symptoms include anxiety, irritability, mood changes, dizziness, sweating, confusion, and headaches. Your insulin dosage may need to change because: changes in physical activity levels, weight gain or loss, increased stress, illness, or dietary changes. Other common side effects may include: reactions at the injection site, itching, rashes, serious allergic reactions (whole body reactions), thickening of the skin or pits at the injection site (lipodistophy), weight gain, swelling of the hands and feet, and possible heart failure if taken with thiazolidions (TZDs). Get emergency medical help if you: difficulty breathing, shortness of breath, rapid heartbeat, swelling of the face, tongue, or throat, sweating, severe drowsiness, dizziness, or confusion. See www.pparx.org or call 1-888-4PPA-NOW. Talk to your health care provider about your diabetes management plan including diet and exercise. General name: Insulin DETEMIR 100[U] in form 1mLDosage: injection, medical solution by Drugs.com. Last updated on 24 March 2020. • Always check insulin labels before administration [see Warnings and Precautions (5.4)]. • Visual inspection for particles and discoloration. Use LEVEMIR only if the solution looks bright and colorless. • Inject LEVEMIR subcutaneously into the thigh, upper arm, or abdomen. • Rotate the injection locations within the same area from one injection to the next to reduce the risk of localized cutaneous lipodysterosis and amyloidosis. Do not inject into areas of lipodystrophy or local cutaneous amyloidosis [see warnings and precautions (5.2), adverse reactions (6)]. • During changes in the patient's insulin regimen, increase the frequency of blood sugar monitoring [see Warnings and Caution (5.2)]. • Use LEVEMIR FlexTouch with caution in patients with visual impairment who may rely on audible clicks to dial their dosage. • Do not dilute or mix LEVEMIR with insulin or another solution. • Levemir is not administered intravenously or at an insulin injection pump. • LEVEMIR can be administered by subcutaneous injection once or twice a day. Prescribe once a day with a night meal or at bedtime. For twice daily doses, prescribe a night dose with a night meal, at bedtime, or 12 hours after the morning dose. • LEVEMIR FlexTouch dials in 1-unit increments. • Individual and levemir dosage headlines based on the patient's metabolic needs, blood glucose monitoring results, and the goal of controlling blood sugar. • Dosage adjustments may be associated with changes in physical activity, changes in dietary patterns (as means, macronutrient content or food intake time), changes in kidney or liver function or during acute illness needed to minimize the risk of hypoglycemia or hyperglycemia [see Warnings and Caution (5.3)]. • In patients with type 1 diabetes, LEVEMIR should be used in a fast-paced or short-operated insulin regimen. • The recommended onset dose of LEVEMIR in patients with type 1 diabetes is approximately one-third to one half of the total daily insulin dose. The remainder of the total daily insulin dose should be administered as short-operated insulin before meals. As a general rule, 0.2 to 0.4 units of insulin per kilogram of body weight can be used to calculate the total initial daily insulin dose in naïve insulin patients with type 1 diabetes. • The recommended dose of LEVEMIR onset in patients with type 2 diabetes is inadequately controlled on oral antidiabetes or GLP-1 drugs An agonist is 10 units (or 0.1 units per kilogram to 0.2 units per kg) given once a day at night or divided into a regimen twice a day. • In case of conversion from insulin geligerin to LEVEMIR, the change can be made unit by unit. • In case of conversion from NPH insulin, change can be made unit by unit. However, some patients with type 2 diabetes may need more LEVEMIR than NPH insulin, as observed in a trial [see clinical studies (14)].
